Human fibronectin 1 DNA, an actin acting substance SegID 1.

(first entry)

02-DEC-2004

```
This invention relates to a novel composition and method for increasing the efficiency of introducing a target substance into a cell.

Specifically, it refers to the introduction of DNA (e.g. the gene of interest to be transfected), polypeptides, sugars or complexes thereof into a cell, and comprises an actin acting substance. The present invention describes the actin acting substance as an extracellular matrix protein, a variant or fragment thereof selected from fibronectin. Inminion or vitronectin. The composition further comprises a gene introduction creagent selected from cationic polymers, cationic lipids, and calcium phosphate, as well as a gold colloid particle that is contacted with the cell. The composition, kit, device or method is useful for increasing the efficiency of introducing a target substance into a cell and thus is useful in the fields of cell biology, genetic engineering and thus company.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Composition comprising an actin acting substance or an actin acting substance and a target substance, useful for increasing the efficiency of introducing a target substance into a cell and in cell biology or genetic engineering.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         prostate tissue; cancer diagnostic; cancer marker; prostate cancer; PCA; male cancer-related death; serum biomarker; tissue biomarker; cytostatic; gene therapy; prostate biopsy tissue; AMACR; alpha-methylacyl-coenzyme A racemase; diagnosing cancer; cell growth;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human prostate cancer diagnosis related DNA sequence SeqID49.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 1929 BP; 507 A; 462 C; 544 G; 416 T; 0 U; 0 Other;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                  2147

Proteins with cell migration stimulatory activity used in treating wound and preventing scarring.

Example 1; Fig 1; 86pp; English.

protein. Host cells containing a replicable vector comprising the MSF encoding nucleic acid can be used for the recombinant production of the protein. The polypeptiale can be used for modulating cell migration, healing a wound and for preventing scarring. The present sequence represents the nucleotide sequence encoding a human MSF1-alpha protein The invention provides a human migration stimulatory factor (MSF)

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                2606114

Sequence 135, Application US/09566921

Patent No. 668288

GENERAL INFORMATION:

APPLICANT: Loring, Jeanne F.

APPLICANT: Tingley, Debora W.

APPLICANT: Edwards, Carla M.

TITLE OF INVENTION: GENES EXPRESSED IN ALZHEIMER'S DISEASE

FILE REPERENCE: PA-0024 US

CURRENT APPLICATION NUMBER: US/09/566,921

CURRENT FILING DATE: 2000-05-05

SOUTHWARE: PERL Program

SOUTHWARE: PERL Program

SEQ ID NO 135

LENGTH: 8044
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               8044

Schor SL, Schor AM; WPI; 1999-430039/36. P-PSDB; AAY28901. Proteins with cell migration stimulatory activity used in treating wound and preventing scarring.

Example 1; Fig 1; 86pp; English.

The invention provides a human migration stimulatory factor (MSF) protein. Host cells containing a replicable vector comprising the MSF encoding nucleic acid can be used for the recombinant production of the protein. The polypeptide can be used for modulating cell migration, healing a wound and for preventing scarring. The present sequence represents the nucleotide sequence encoding a human MSF1-alpha protein

    The invention provides a human migration stimulatory factor (MSF) protein. Host cells containing a replicable vector comprising the MSF encoding nucleic acid can be used for the recombinant production of the protein. The polypeptide can be used for modulating cell migration, healing a wound and for preventing scarring. The present sequence represents the human MSF1-alpha protein
                                                                                                                                                                                                                                                                                                                                                                                      ATCACTIGCACTICTAGAAATAGAIGCAACGAICAGGACCAAGGACAICCTATAGAATT

Proteins with cell migration stimulatory activity used in treating wound and preventing scarring.

Claim 1; Page 53; 86pp; English.

The invention provides a human migration stimulatory factor (MSF) protein. Host cells containing a replicable vector comprising the MSF encoding nucleic acid can be used for the recombinant production of the protein. The polypeptide can be used for modulating cell migration, healing a wound and for preventing scarring. The present sequence represents the human MSFI-alpha protein

This invention describes novel cytostatic polymucleotide and polypeptide sequences which can be used in a method for diagnosing prostatic cancer. Cor the risk of developing prostatic cancer. Diagnosis is based on determining over transcription or over expression of the sequences in prostatic tissue. Screening for inhibitors of the sequences or detection or imbstances involves a binding assay, any compounds that bind are selected, optionally after deconvolution of mixtures. Detection of a predetermined minimum level of the reporter indicates the presence of tumour cells. Inhibitors can be chosen from antisense oligomoleotides, short-interfering RNA or ribozymes; an organic molecule of molecular overght below 5000, preferably 300, that binds to the polypeptide, an aptamer against the polypeptide; a (monoclonal) antibody (Ab) against the colypeptide, preferably humanised or human; an anti-idiotype, non-human (monoclonal) antibody directed against Ab or any of the above derivatised with a reporter group, cell toxin, immunostimulatory molecules and/or cancer by differential expression analysis, using DNA microarrays. Concer by differential expression analysis, using DNA microarrays. Concert cancer patients of prostatic cancer samples showed that CD24 was upregulated in many of them. Sections of tissue, isolated from prostatic cancer patients, or subjects at risk, were incubated concertained with hamalum (blue). Malignant calls stained serond antibody; streptavidin-conjugated horseradish camples were counterstained with hemalum (blue). Malignant calls stained seronds manibodismic staining was very strong, and ophymolectide and cytoplasmic staining was very strong, and polymenticlectide and polypeptide sequences used in the metabresent the invarience.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes nucleic acids (1) associated with bladder cancer tissue. Also described: (1) peptides and proteins (11) containing an amino acid sequence encoded by (1): (2) a method for diagnosing bladder cancer (BC), or monitoring its progression, that uses (I). (II) or agents (Z) that inhibit, or bind to, (1) or (II), labelled with a reporter; and (3) a method for treating BC that uses (I), (II) or (Z). (I) have cytostatic activity. (I) and (II) can be used to detect (and monitor progression of) bladder cancer (BC), or the risk of developing it; to screen for specific binding agents (Z), and to treat BC. (Z) are also useful as diagnostic and therapeutic agents. The present sequence represents a human nucleotide sequence associated with bladder cancer, which is used in the exemplification of the present invention.

The invention relates to a novel method for identifying an individual who comprises detected risk for developing myocardial infarction. The method comprises detecteding a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's contest card risk for myocardial infarction in the individual. The invention cut terret comprises: an isolated nucleic acid molecule comprising at least cut expecification or its complement and encoding any one of the invention the specification in the specification; an isolated polypeptide comprising an amino acid sequence given in the specification; an isolated polypeptide comprising an amino acid sequence given in the specification; an isolated polypeptide of that specification and which is between about 16 and 1000 nucleotides in the specification and which is between about 16 and 1000 nucleotides in contrainty a kit for detecting an SNP in a nucleic acid molecule; a method of detecting an SNP in a nucleic acid molecule; a method of detecting an variant polypeptide; and contrainty an agent useful in treating or preventing an SNP in a nucleic acid molecule; an enthod of detecting a variant polypeptide; and comprise of the invention may be used in gene therapy. The method is useful in identifying an individual who has an increased or method is useful in identifying an individual who has an increased or method is useful in identifying an individual who has an increased or method or method is useful in identifying an individual who has an increased or method or many and proven and an infarretion and for many and for many and for many and for many and an infarretion and the movel detecting an infarretion and method for identifying an individual who has an increased or method or method for identifying an infarretion and for many and for many and for many and an increased or method for identifying an individual who has an increased or method for identifying an individual who has an increased or method for identifying an indiv

This polymuclectide sequence represents a human myocardial infarctionassociated gene containing one or more SNP's of the invention. Note: This sequence was not shown in the specification. The sequence has come from an electronic sequence listing downloaded from the WIPO website.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -----ying an individual who has an altered risk for developing myocardial infarction by detecting a single nucleotide polymorphism in the individual's nucleic acids.

                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a novel method of characterising prostate tissue in a subject and to compositions and methods for cancer diagnostics, including cancer markers, in particular prostate cancer. PCAD is a leading cause of male cancer-related death.

Compounds serum and tissue biomarkers would aid diagnosis. The invention may provide means of producing compounds with a cytostatic activity or allow the development of gene therapy. The methods of the invention useful for characterising prostate tissue in a subject, screening compounds, characterising inconclusive prostate biopsy tissue in a subject, detecting AMACR (alpha-methylacyl-coenzyme A racemase)

compounds cancer in a bodily fluid, characterising tissue in a subject, diagnosing cancer in a subject and inhibiting the growth of cells. The present sequence is a DNA sequence which is preferably utilised in the compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            242
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            302
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 362

comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's nucleic acids where the presence of the SNP is correlated with an uncleic acids where the presence of the SNP is correlated with a nucleic acids where the presence of the SNP is correlated with a newtiton of turther comprises; an isolated nucleic acid molecule comprising at least a contiguous nucleotides where one of the nucleotides is an SNP given in the specification or its complement and encoding any one of the amino acid sequences given in the specification; an antibody comprising an amino acid sequence given in the specification; an antibody that specification and which is between the specification in the comprising an amplified polynucleotide containing an SNP given in the specification and which is between about is and 1000 nucleotides in clength; a kit for detecting an SNP in a nucleic acid molecule; a method of detecting a variant polypeptide; and a method for identifying an agent useful in treating or preventing mycardial infarction. The novel detection method has cardiant activity. The nucleic acids of the invention may be used in gene therapy. The method is useful in identifying an individual who has an increased or decreased risk for developing mycardial infarction and for preparing a composition for treating or preventing mycardial infarction. This polynucleotide sequence represents a human mycardial infarction. This polynucleotide sequence represents a human mycardial infarction. This sequence was not shown in the specification. The sequence has come from an electronic sequence listing downloaded from the NIPO website.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  140

prostatic tissue. Screening for inhibitors of the sequences in prostatic tissue. Screening for inhibitors of the sequences in prostatic tissue. Screening for inhibitors of the sequences or detection brootseld by alternovives a binding assay, any compounds that bind are substances involves a binding assay, any compounds that bind are selected, optionally after deconvolution of mixtures. Detection of a predetermined minimum level of the reporter indicates the presence of theorem cells. Inhibitors can be chosen from antisense oligomucleotides, short-interfering RNA or ribozymes; an organic molecule of molecular estamer against the polypeptide, and monoclonal) antibody (Ab) against the polypeptide, preferably humanised or human; an anti-idotype, non-human (monoclonal) antibody directed against Ab or any of the above derivatised at the reporter group, cell toxin, immunostimulatory molecules and/or radioisotope. The polyputoleotides are identified in human prostatic cancer by differential expression analysis, using DNA microarrays, between normal and tumorous tissues, with (over)expression being detected by quantitative PCR. Analysis of prostatic cancer samples showed that CT24 was upregulated in many of them. Sections of tissue, isolated from prostatic cancer patients, or subjects at risk, were incubated concernatially with anti-human CD4 murine monoclonal antibodies; between the diaminobenzidine as colour former (brown). The samples were counterstained with hemalum (blue). Malignant cells stained strongly but non-malignant cells end; weakly. In 15 of 63 samples and denocarcinoma, membrane and cytoplasmic staining was very strong, and lymph node metastases were also stained. ADR65805-ADR66954 represent the invention. developing prostatic cancer. Diagnosis is based on invention

This invention describes novel cytostatic polynucleotide and polypeptide sequences which can be used in a method for diagnosing prostatic cancer or the risk of developing prostatic cancer. Diagnosis is based on determining over transcription or over expression of the sequences in prostatic tissue. Screening for inhibitors of the sequences or detection or substances involves a binding assay, any compounds that bind are selected, optionally after deconvolution of mixtures. Detection of a predetermined minimum level of the reporter indicates the presence of tumour cells. Inhibitors can be chosen from antisense oligonucleotides, short-interfering RNA or ribozymes; an organic molecule of molecular of spott below 5000, preferably 300, that binds to the polypeptide; an aptamer against the polypeptide; a (monoclonal) antibody directed against Ab or any of the above derivatised with a reporter group, cell toxin, immunostimulatory molecules and/or radioisocope. The polymucleotides are identified in human prostatic cancer by differential expression analysis, using DNA microarrays, cancer by differential expression analysis, using DNA microarrays. CC cancer by differential expression analysis, using DNA microarrays, copy quantitative PCR. Analysis of prostatic cancer samples showed that CD24 was upregulated in many of them. Sections of tissue, isolated from prostatic cancer patients, or subjects at risk, were incubated sequentially with anti-human CD4 murine monoclonal antibodies; cc sequentially but non-malignant cells only weakly. In 15 of 63 amples of errongly but non-malignant cells only weakly. In 15 of 63 amples of errongly but non-malignant cells only weakly. In 15 of 63 amples of copy. Invention copy plymuclectide and cytoplasmic staining was very strong, and invaluent on polymetide sequences used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CysThrCysIleGlyAlaGlyArgGlyArgIleSerCysThrIleAlaAsnArgCysH18 160

                                                                                                                                                                                                                                             The present invention relates to novel human cell adhesion and extracellular matrix proteins, CADECM-1 to CADECM-22, and their coding sequences sequences (ACC00392-ACC00413 and ABR40104-ABR40125). The coding sequences and proteins are useful in diagnosing, treating and preventing disorders associated with aberrant expression of CADECM, such as immune system disorders (e.g. AIDS or allergies), neurological disorders (e.g. stroke, Parkinson's disease or epilepsy), developmental disorders (e.g. Down's syndrome or cerebral palsy), connective tissue disorders (e.g. systemic lupus erythematosus), genetic disorders (e.g. Alport's syndrome) or cell proliferative disorders (e.g. cancer or atherosclerosis)

The invention relates to a novel method for diagnosing and analysing autoimmune disease or arthritides. The method comprises obtaining a sutoimmune disease or arthritides. The method comprises obtaining a patient sample containing maken, analysing gene expression using the mixed that results in a gene expression signature of the mixed, and using that came comprises in the patient, where gene expression of at least 60% of the genes correlates with that of the gene expression of a least 60% of the genes correlates with that of the gene expression of a least 60% of the genes correlates with that of the gene expression of a least 60% of the genes for targeting in the treatment of rheumatoid arthritis; identification of the than a mouse; appendix of theumatoid arthritis; diagnosis or array or gene chip, appendix of rheumatoid arthritis; diagnosis or array or gene chip, appendix of rheumatoid arthritis; diagnosis or analyses of autoimmune disease or rheumatoid arthritis; and reducing the symptoms associated with collagentinduced arthritis and reducing the symptoms associated with collagentinduced arthritis. The compositions of the invention have the following activities: immunosuppressive, antirheumatic, antiamnosuppressive, antirheumatic, antiamnosuppressive, antirheumatic, antimunosuppressive, antirheumatic, antimunosuppressive, antirheumatic, antimunosuppressive, antirheumatic, antimunosuppressive, antirheumatic, antimunosuppressive, antirheumator, dermaclogical, and immunosuppressive, antirheumatic, antimunosuppressive, antirheumatic, antipunosuppressive, antirheumatic, antipunosuppressive, antirheumatic, antipunosuppressive, antirheumatic, antipunosuppressive, antirheumatic, antipunosuppressive, antirheumatic, antipunosuppressive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           140
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   120

CC differentiate into a metastatic cancer cell, the method involves CC identifying a mutated fibronectin in the cell. The method of the CC invention is useful for preventing metastatic cancer. The present DNA CC sequence represents a human fibronectin gene.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention comprises a method for diagnosing colon cancer in an individual, the method involves obtaining a serum sample from the individual and detecting the presence of either TIMP1 or Regl-alpha and an additional colorectral cancer-associated marker. The method of the invention is useful for diagnosing colon cancer in an individual. The present DNA sequence represents a human colorectal cancer-associated protein coding sequence of the invention.

The present invention describes nucleic acids (I) associated with bladder cancer tissue. Also described: (1) peptides and proteins (II) containing an amino acid sequence encoded by (I); (2) a method for diagnosing bladder cancer (BC), or monitoring its progression, that uses (I), (II) or agents (Z) that inhibit, or bind to, (I) or (II), labelled with a reporter; and (3) a method for treating BC that uses (I), (II) or (Z). (I) and (II) have cytostatic activity. (I) and (II) can be used to detect (and monitor progression of) bladder cancer (BC), or the risk of developing it; to screen for specific binding agents (Z), and to treat BC. (Z) are also useful as diagnostic and therapeutic agents. The present sequence represents a human nucleocide sequence associated with bladder cancer, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GlnGlnTrpGluArgThrTyrLeuGlyAsnAlaLeuValCysThrCysTyrGlyGlySer 100

the individual's nucleic acids.

Claim 7; SEQ ID NO 241; 145pp; English.

The invention relates to a novel method for identifying an individual who has an altered risk for developing myocardial infarction. The method comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's nucleotide sequences given in the specification in the individual's can be invention attended risk for myocardial infarction in the individual. The invention curlet camprises: an isolated nucleic acid molecule comprising at least septiments and encoding any one of the amino acid sequences given in the specification; an isolated polypeptide comprising an amino acid sequence given in the specification; an antibody that specification and which is between about 16 and 1000 nucleotides in specification and which is between about 16 and 1000 nucleotides in length, a kit for decetting an SNP in a nucleic acid, comprising the nucleic acid molecule; a method of detecting an SNP in a nucleic acid molecule; a method of detecting a variant polypeptide; and nucleic acid molecule; a method of detecting a variant polypeptide; and myocardial infarction. The novel detection method has cardiant activity. The nucleic acids of the invention may be used in gene therapy. The composition for treating or preventing myocardial infarction. This composition for treating or preventing myocardial infarction. This composition for treating or preventing myocardial infarction. This sequence was not shown in the specification. The sequence has come from a electronic sequence listing downloaded from the WIPO website.

The invention relates to a novel method for identifying an individual who has an altered risk for developing myocardial infarction. The method comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's nucleif acids esquences given in the specification in the individual's altered risk for myocardial infarction in the individual. The invention curvature comprisates: an isolated nucleic acid molecule comprising at least the specification or its complement and encoding any one of the amino acid sequence given in the specification; an isolated polypeptide or comprising an amino acid sequence given in the specification; an antibody that specification and which is between about 16 and 1000 nucleotides in the specification and which is between about 16 and 1000 nucleotides in comprising the polymucleotide containing an SNP given in the specification and which is between about 16 and 1000 nucleotides in comprising the polymucleotide, a buffer and an enzyme; a method of detecting an SNP in a nucleic acid molecule; a method of detecting an variant polypeptide; and myocardial infarction. The novel detection method has cardiant activity. The nucleic acids of the invention may be used in gene therapy. The myocardial infarction. The novel detection method has an increased or decreased risk for developing myocardial infarction. This composition for treating or preventing myocardial infarction. This composition for treating or preventing myocardial infarction. This sequence was not shown in the specification. The sequence has come from associated gene containing one or more SNP's of the invention. Note: This associated gene containing downloaded from the WIPO website.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          438
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            498

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel method for identifying an individual who has an altered risk for developing myocardial infarction. The method comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        8 6
```

cc nucleic acids, where the presence of the SNP is correlated with an altered risk for myocardial infarction in the individual. The invention current comprisates: an isolated nucleic acid molecule comprising at least so contiguous nucleotides where one of the nucleotides is an SNP given in the specification, an isolated polypeptide comprising an amino acid sequence given in the specification, an antibody that specifically binds to the polypeptide or its antigen-binding comprising an amplified polynucleotide containing an SNP given in the specification and which is between about 16 and 1000 nucleotides in cleageth; a kit for detecting an SNP in a nucleic acid molecule, a method of detecting an variant polypeptide; and comprising the polynucleotide, and an enzyme; a method of detecting an SNP in a nucleic acid molecule; and effect and an enzyme; a method of detecting an variant polypeptide; and composition and entity in the section method has cardiant activity. The nucleic acids of the invention may be used in gene therapy. The method is useful in identifying an individual who has an increased or decreased risk for developing myocardial infarction. This composition for treating or preventing myocardial infarction. The sequence was not shown in the specification. The sequence has come from an electronic sequence listing downloaded from the WIPO website.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         33,
